I am Kushal Dhamala, a recent BCA graduate with a passion for Data Science and Machine Learning. I possess hands-on experience in building and deploying predictive models, including Logistic Regression, Decision Trees, and CNNs, as demonstrated by my Customer Churn and Plant Disease Detection projects. I have a solid foundation in data preprocessing (cleaning, scaling, and transformation) and dimensionality reduction techniques like PCA. I am eager to apply my analytical and technical skills to contribute directly to data-driven decision-making within a dynamic team.

My academic focus was strongly concentrated on advanced analytical techniques, with Artificial Intelligence as a key elective in my seventh semester and subsequent coursework in Machine Learning and IoT during my final semester.

## EXPERIENCE

### DotNet Developer (Intern)

Anamnagar

Technology Solution Nepal

Nov, 2023 - Jan, 2024

.NET Developer Intern at Technology Solution Nepal. Contributed to the development of an Inventory Management System (JAIMS) , gaining experience in application development, applying the Onion Architecture for scalable design, and integrating with Microsoft SQL Server.

## EDUCATION

### Bachelor's in Computer Application (BCA)

Everest College

Dec, 2019 - Sep, 2024

I earned my Bachelor's in Computer Application (BCA) from Everest College, completing the program from December 2019 to September 2024, with an overall GPA of 3.21. This rigorous curriculum provided a strong technical foundation in core areas such as software engineering, data structures, algorithms, and database management. Crucially, I focused my studies on advanced analytical fields, choosing Artificial Intelligence (AI) as a key elective in the seventh semester, followed by specialized coursework in Machine Learning (ML) and Internet of Things (IoT) during the final semester. My academic experiences have equipped me with the comprehensive technical skills necessary for both software development and analytical roles.

## PROJECTS

### JAIMS (Jewellery Account and Inventory Management System For Retailers)

During my internship, I contributed to the development of JAIMS, a Jewellery Account and Inventory Management System. The project was built using the .NET framework in Visual Studio Code, adhering to the Onion Architecture for a structured and scalable design. My primary responsibilities involved designing and implementing user-friendly forms for the system and contributing to backend database operations using Microsoft SQL Server to ensure seamless integration and functionality. This experience honed my skills in application development, database management, and collaborative software design.

### Plant Disease Detection

- The Plant Disease Detection project is designed to identify plant diseases from leaf images using machine learning. The system utilizes a Convolutional Neural Network (CNN) to analyze images and classify plant diseases accurately.
  - Key Achievement: Achieved 95% classification accuracy across 14 plant disease classes by implementing a custom CNN model trained using Jupyter Notebook.
  - Deployment: The model is integrated with a web interface built using Flask and Python.
  - Analytical Component: Applied Dijkstra's Algorithm to determine the optimal path for delivering medicine to affected areas.

### Customer Churn Prediction

A Customer Churn Prediction system that uses machine learning to analyze customer behavior and predict the likelihood of churn. It helps businesses identify at-risk customers and take proactive measures to improve retention and loyalty.

- Key Achievement: Implemented a Logistic Regression model following extensive data preprocessing (scaling, transformation) to predict customer churn.
- Performance Metrics: Achieved a model F1-Score of 0.83 and Precision of 85%, providing high confidence in identifying vulnerable customer segments.

### Loan Approval System

A loan approval prediction system that uses machine learning to analyze applicant data and predict whether a loan should be approved. It helps banks and financial institutions make faster, data-driven, and more accurate lending decisions.

- Key Achievement: Developed and optimized a Logistic Regression model using applicant features to automate and streamline the loan decision process.
- Performance Metrics: The model delivered an 88% accuracy and a Recall of 84%, demonstrating reliable performance in minimizing false negatives.

### Front-end developer for the website "Sujen Technical Elevator Service"

Developed a responsive front-end website for Sujen Technical Elevators using HTML, CSS, JavaScript, and Bootstrap, focusing on clean design, smooth user experience, and mobile-friendly performance.

<https://stechelevators.com/>

### SKILLS

---

Data Science, Python, Machine Learning, Data Handling: Numpy, Pandas, Matplotlib, Feature engineering, Data Cleaning, Database (MYSQL), Flask, Frontend Web Development (HTML CSS JS Bootstrap React)

### LANGUAGE

---

Nepali, English, Hindi
